

Jacam Chemicals LLC claimed to employees that they do not generate process waste. It was discovered that they dispose of waste by pumping it into an injection well. A search with the Kansas Department of Health and Environment has revealed that the well at the dump site is not a Class I, III, or V injection well.

Physical surveillance of the company and well site were conducted on January 16, 2014 and January 22, 2014. Jacam trucks were observed taking totes of an unknown liquid to the well site for disposal. On both occasions, the totes/containers were transported to the injection well after 4pm.
